FOR IMMEDIATE RELEASE

**LEADING NEXT GENERATION INTERNET COMPANY LAUNCHES NEW
MOBILE CONVERGENCE AND BUSINESS AND INFORMATION DIVISIONS**

**Command Information Continues Rapid Expansion into
Mobile Connectivity, Telematics, IMS and more**

HERNDON, VA, March 9, 2006 – The U.S. is entering a new Internet era – that of IPv6 – and Command Information (www.CommandInformation.com) is leading the way with the creation of two new business units: Mobile Convergence, and Business and Information. IPv6 is the next generation Internet protocol designed to replace the current version, IPv4, greatly expanding the use of the Internet in our lives. Command Information is the largest and fastest growing pure-play IPv6 solutions company in America.

Command Information's Mobile Convergence division is led by Flavio Sonis, who has held key management positions with such Fortune 500 companies as IBM, Motorola, Sprint, Nextel and AOL. Forrest Snowden, who has more than two decades of professional experience in multimillion dollar consulting engagements and was one of the original founders of BearingPoint's U.K. division, will head the Business and Information unit. In these new vice president and general manager positions, Sonis and Snowden are members of the executive team, led by Tom Patterson, chief executive officer of Command Information.

"IP Multimedia SubSystems or IMS, represent the future of the mobile telephony market. IPv6 unlocks the power of IMS, and IMS unlocks the value in telecom," said Patterson. "The biggest return on an IPv6 investment comes when you adapt your business processes and programs to leverage the new capabilities. Forrest's group will provide this enterprise-level support for organizations. Flavio and Forrest's leadership is crucial in building both of these divisions to support our growing base of government and corporate clients."

A recent Department of Commerce study valued the IPv6 market at more than \$25 billion over the next 25 years with almost a 10:1 return on investment possible when implemented properly, and The Yankee Group estimates that approximately 55 percent of U.S. businesses will deploy a wireless data solution by mid-2006. Command Information's Mobile Convergence practice unites these two major market forces by focusing on an individual company's needs, and designing systems that leverage new technologies to help clients enhance and streamline the end user experience.

Snowden's Business and Information practice provides business process design, IT and information strategy, and portal/eCommerce solutions development, joining Command's agile software development group, Digital Focus and IPv6 training software group Native6, positioning Command Information as the dominant resource for organizations seeking to leverage IPv6.

About Command Information

Command Information (www.CommandInformation.com) is the largest pure-play IPv6 Solutions provider in America, offering strategy, tactical direction and application development services for Fortune 1000 companies and government organizations seeking to move to the fast-emerging new version of Internet protocol. The Herndon, VA-based company focuses on the six key areas required to leverage IPv6: IPv6 training, transformation, and strategy, application development, application and infrastructure security, mobile convergence and telematics, business and information strategy, and network architecture and implementation. Command Information's Application Development practice is led by Digital Focus (www.digitalfocus.com), a leader in agile software development and integration services.
